MULTISTACK®

Efficiency Integrated free cooling coil for full cooling capacity without compressor operation. Efficiently matches load with free cooling as first stage of cooling, additional cooling from modulating compressor operation. Multiple module array precisely matches the load for peak chiller efficiency at all load conditions.

Modular Design Simply add a module for N+1 redundancy perfect for critical cooling applications. Easily add capacity as needed, when needed. Accessory modules including pumps and other components make it easy to create a complete chilled water plant.

Serviceability

Compressor and heat exchanger access without removing other major components. Total access™ design gives complete per module service and maintenance access without affecting other module operation. Single, integrated refrigerant/water coil easily cleaned in place.

Packaged Controls

Chiller master controller for built-in free cooling and compressor control. Designed as standard for variable-primary chilled water system operation.

Ultra-Quiet Operation

Residential zoning? With Multistack's standard low-noise fans and optional custom designed low sound options, ASF's will meet even the most stringent sound requirements.
